

# INTERCHANGEABLE SYSTEM

## SPECIAL, ADAPTED, EFFECTIVE.

**A large selection for the winter season: At BROCK, customers decide for themselves. For example, whether a hook-lift or twist-lock container support is preferred.** Waste management operators with a hook-lift system can expand their services more attractively with a BROCK assembly than with any of the other systems currently in use, such as Meiler, Gergen or VDL.

**Every BROCK vehicle can be easily adapted for winter service using one of the common gritting systems.** Flexibility, reliability and the robust construction are trademarks of all sweepers manufactured by BROCK. The high degree of user-friendliness and a multitude of special functions provide effective support for operators as they go about their everyday work - throughout the year.

**This means that an effective street sweeper can be easily turned into an all-round assistant for winter road service.** This cost-effective solution allows the sweeper to be used efficiently the entire year while avoiding downtime. The many demands presented by winter service - from snow removal to the spreading of various forms of grit - are met by BROCK with a diverse selection of auxiliary equipment, ensuring that each vehicle is optimally adapted to the specific tasks to be accomplished during the winter months.
